History of Biohacking

Definitions

Google

bi·o·hack·ing

/ˈbɪŋhækɪŋ/

noun

the activity of exploiting genetic material experimentally without regard to accepted ethical standards, or for criminal purposes.

Wiktionary

biohacking

n. The manipulation of [DNA](#) or other aspects of [genetics](#) either for [fun](#), or [maliciously](#)

♥ More at Wordnik | from Wiktionary, Creative Commons Attribution/Share-Alike License

TOP DEFINITION

biohacking

refers to managing one's own biology using a combination of medical, nutritional and electronic techniques.

I'm going to do some biohacking on my hangover by getting some IV hydration with essential nutrients.

[#bio hack](#) [#biohacker](#) [#bullet proof](#) [#biopunk](#) [#cybernetic](#)

Urban
Dictionary

What it means to be a hacker

- Create & Share
- Freedom of inquiry
- Hostility to secrecy
- Sharing as ideology and strategy
- The right to fork
- Emphasis on rationality
- Distaste of authority
- Playful cleverness

We have always been biohackers

A chimaeric antibiotic resistance gene as a selectable marker for plant cell transformation

MICHAEL W. BEVAN^{*}, RICHARD B. FLAVELL^{*} & MARY-DELL CHILTON[†]

^{*}Plant Breeding Institute, Maris Lane, Trumpington, Cambridge CB2 2LQ, UK

[†]Department of Biology, Washington University, St Louis, Missouri 63130, USA

The T-DNA region of *Agrobacterium tumefaciens* tumour-inducing plasmids of the nopaline type¹ contains a gene coding for the enzyme nopaline synthase. This gene is expressed constitutively in host plant cells to which it is transferred during tumour induction². We have exploited the regulatory elements of this gene to construct a chimaeric gene that confers antibiotic resistance on transformed plant cells. The chimaeric gene encodes the expected chimaeric transcripts in plant cells, and confers on transformed cells the ability to grow in the presence of normally lethal levels of the antibiotic G418 (ref. 3). Experiments using *in vitro* transformation techniques on single plant cells indicate that this antibiotic resistance can be used as a selectable marker, and can therefore be used in selecting cells transformed by T-DNA vectors that have had the genes for hormone autotrophy deleted⁴. Plant cells transformed by such 'disarmed' T-DNA vectors can be regenerated into entire plants, whose sexual progeny contain unaltered copies of the inciting T-DNA⁵. The availability of this dominant selectable marker should allow a wider range of experiments to be undertaken using different host plants.

Super powers

What are the big players up to?

RNAi in agriculture

A photograph of a man with grey hair, wearing an orange and black plaid shirt and blue jeans, standing in a vast field of green crops. He is seen from behind, with his right hand on his hip and his left hand raised to his forehead, looking out over the horizon under a clear blue sky. The crops are dense and green, stretching to the horizon.
